■ SECTION 01

What is Project Dash

An Ofwat-funded national trial inviting 30 forward-thinking commercial buildings to test the UK's first predictive, cross-vector water telemetry and insurer-backed management ecosystem.

THE PROBLEM

10–30% of water in UK commercial buildings is wasted

DURATION

18-month study, through Dec 2027

COST TO YOU

Zero fees, plus £10k+ of free tech per site

ZERO DISRUPTION

No shutdown, no tenant interruption, out-of-hours install

■ SECTION 02

The consortium

Led and delivered by premier industry, insurance and academic partners under Ofwat funding.

Project lead and wire-free sub-metering

Occupancy & energy sensing

Accredited plumbing and FM response

Insurer validation and escape-of-water risk

Water retail and consumption data

Water efficiency strategy

Behavioural insight and evaluation

Tenant engagement and nudge toolkits

Ofwat Funded by Ofwat under the Water Efficiency Lab (WEL 1)

■ SECTION 03

Why join the cohort

01 Instant bill and carbon cuts

Catch silent urinal leaks, continuously running cisterns and hot water recirculation waste. Scope 1 and 2 utility emissions fall from week one.

02 Aviva insurer validation

Co-design the UK property safety standard and receive an Aviva-backed Water Management Plan to mitigate escape-of-water risk.

03 Keep the equipment forever

All sub-meters and automated isolation shut-off valves remain the permanent capital property of your building at zero charge.

■ SECTION 04

Continuous improvement loop

Occupancy and flow correlated in real time, from IoT signal to FM fix to insurer-validated outcome, then back to sharper detection.

IOT

Data Sources

Quensus sub-metering +
Direk wire-free occupancy
& energy loggers.

AI

Cross Vector

Correlates water
consumption against live
room presence to flag
hidden flow & dead legs.

FIX

FM Response

Auto valve shut-off &
prioritised fix lists
seamlessly routed into
Wates FM workflows.

VALUE

Outcomes

Permanent cost reduction,
Aviva insurance validation,
and zero disruption to daily
tenants.

- Outcomes feed back into the model, and detection sharpens across all 30 sites as the cohort matures.

Addressing key challenges

Will building tenants be interrupted?

No shutdown is required. Installation can be scheduled out-of-hours or at weekends, water isolation is held under 60 minutes per washroom, and no main external stopcocks are closed.

How is maintenance safety managed?

All work is executed by accredited, pre-vetted Waters plumbers under strict RAMS. Continuous flow telemetry flags stagnant water and dead legs, strengthening your maintenance safety oversight and routines.

Are occupancy sensors privacy and GDPR safe?

Fully compliant. Direk sensors use wire-free infrared spatial heat footprints. No cameras, no microphones and no personal data collection. All occupancy telemetry is anonymised at zone level.

What happens when the trial ends?

You keep all installed sub-meters and isolation valves free of charge as permanent building assets. Take an optional low-cost cloud analytics subscription, or retain the plumbed manual shut-offs. Zero lock-in.

■ SECTION 06

Next steps

From confirmation to audited reporting, the implementation is designed to take almost nothing from your team.

Nominate your building for Project Dash

Selection is underway. 30 UK sites are admitted on a first-confirmed, fully funded basis. Zero fees, zero tenant disruption.
